S2 PUSHBUTTON OPERATION

If the NOTARY DELAY SWITCH is in position F, S2 operates as a reset switch to open the relay and end the CONTINUOUS relay after a valid signal from a detector.

If S1 is in any other position (0 thru E), S2 operates as a test switch that is closed for the delay time selected by the rotary selector switch after S2 is released. If during the delay period, S2 is depressed, the relay will open immediately.

S2 will not function if there is a valid signal from a detector. If a valid detector signal is received after S2 has been depressed, the test will be interrupted, and the detector signal received. After the detector signal and any delay time has expired, a new test can be started by depressing S2.
